## Linguistic applications team semantics

**Team semantics:** formulas interpreted wrt a set of points of evaluation (a team) rather than single ones [Hodges 1997, Väänänen 2007]

### Early application

IF-LOGIC: **branching in natural language** [Henkin 1959, Hintikka 1973]

- (1) a. Some<sub>y</sub> relative of each<sub>x</sub> villager and some<sub>w</sub> relative of each<sub>z</sub> townsman hate each other  
 b.  $(\forall x)(\exists y)(\forall z)(\exists w/\forall x)R(x, z, y, w)$

Status of branching controversial in logical-linguistic literature:

- Branching generalized quantifiers (Barwise79, Westerståhl87, van Benthem89)
  - Doubts about evidence for branching in linguistic literature (Fauconnier75)
  - Schlenker06: branching in DE positions & **exceptional scope of indefinites** (Brasoveanu & Farkas11)
- (2) a. If **some relative** of mine dies, I will inherit a house  $[\exists/ \rightarrow] \& [\rightarrow / \exists]$   
 b. If **every relative** of mine dies, I will inherit a house  $\text{only } [\rightarrow / \forall]$

### A recent application

DEPENDENCE LOGIC: **exceptional scope & (non)specificity across languages**  $\Leftarrow$

- MA & Marco Degano, 2022. “(Non-)specificity across languages: constancy, variation, v-variation.” SALT 32

## Linguistic applications team semantics

### INQUISITIVE (EPISTEMIC) LOGIC: **questions and attitude verbs**

[Ciardelli & Roelofsen 2011, 2015; Ciardelli, Groenendijk & Roelofsen 2018]

- (3) a. Aicha knows/#wonders/believes that it is raining  
 b. Aicha knows/wonders/#believes whether it is raining

### BILATERAL STATE-BASED MODAL LOGIC (BSML): **free choice and ignorance inferences**

[Anttila 2021; MA 2022; Anttila, MA & Yang 2023]

- (4) a. You may go to the beach *or* to the cinema  $\rightsquigarrow$  You may go to the beach  
 b. The prize is in the attic *or* in the garden  $\rightsquigarrow$  Speaker doesn't know where

**Main hypothesis:** non-classical inferences result from a tendency in human cognition to avoid empty representations (neglect-zero); (**New conjecture:** the ability to split states is acquired late)

BSML: Propositional Modal Logic + NE (+ F)     $[M, s \models \text{NE} \text{ iff } s \neq \emptyset]$

### Common idea

Teams as information states, i.e., sets of alternative possible situations compatible with the agent's belief/information

[Stalnaker 1978]

## Teams as information states: propositional case

**Team:** a set of valuations / possible worlds

$$(5) \begin{array}{c|c} p & q \\ \hline 1 & 0 \\ 1 & 1 \end{array} \Rightarrow \text{the info that } p \text{ is true and that } q \text{ might be true or false}$$

$$(6) \begin{array}{c|c} p & q \\ \hline 1 & 0 \\ 0 & 1 \end{array} \Rightarrow \text{the info that either only } p \text{ is true or only } q$$

$$(7) \begin{array}{c|c} p & q \\ \hline 0 & 0 \end{array} \Rightarrow \text{the info that } p \text{ and } q \text{ are both false} \quad [\Leftarrow \textit{max info}]$$

(a) Team 1

(b) Team 2

(c) Team 3

## Teams as information states: two-sorted f-o case

**Team:** a set of assignments in a two-sorted framework with designated variable  $v$  ranging over possible worlds

$$(8) \quad \frac{v}{\begin{array}{l} w_p \\ w_q \end{array}} \Rightarrow \text{the info that only } p \text{ is true or only } q \quad [\Leftarrow \textit{initial team}]$$

$$(9) \quad \frac{v \quad x}{\begin{array}{l} w_1 \quad a \\ w_2 \quad a \\ w_3 \quad a \end{array}} \Rightarrow \text{value of } x \text{ is known}$$

$$(10) \quad \frac{v \quad x}{\begin{array}{l} w_1 \quad a \\ w_2 \quad b \\ w_3 \quad c \end{array}} \Rightarrow \text{unknown but specific} \quad \frac{v \quad x}{\begin{array}{l} w_1 \quad a \\ w_1 \quad b \\ w_1 \quad c \end{array}} \Rightarrow \text{non-specific}$$

Linguistically relevant distinctions that we can characterise using dependence atoms

## A wealth of indefinites

Cross-linguistically, we witness a wealth of indefinite forms:

- English: *some, any, no, ...*
- Italian: *qualunque, nessuno, (un) qualche, ...*
- Dutch: *iets, enig, wie dan ook, niets, ...*
- German: *ein, irgendein, ...*
- Russian: *koe-, -to, -nibud, ...*
- Spanish: *algún, cualquiera, ningun, ...*
- Náhuatl/Mexicano: *yeka, sente, olgo, ...*
- Kannada: *-oo, -aadaruu, ...*
- Mandarin: *shenme, ...*
- ...

Why this variety? What do all these forms have in common? How to account for their differences in meaning and distribution?

**Today's focus:** scopal (specific vs non-specific) and epistemic (known vs unknown) uses of indefinites.

## Haspelmath Map

Haspelmath (1997)'s map: a useful typological tool to capture the functional distribution of indefinites

Haspelmath's map (extended, Aguilar et al 2011)

Haspelmath's implicational map makes predictions about

- (i) possible indefinite forms cross-linguistically (only those occupying a contiguous area on the map);
- (ii) their possible diachronic development (contiguous functions developed first).

## Scopal vs epistemic specificity (Farkas, 1996)

### Scopal specificity

Indefinites marked for specificity tend to presuppose the existence of their referent, and introduce discourse referents:

(11) Ali wants to visit an Italian city.

- a. **Specific:** There is a specific Italian city which Ali wants to visit

[ $\exists x/\square$ ]

- b. **Non-specific:** Ali wants to visit an Italian city, any Italian city would do

[ $\square/\exists x$ ]

[Continuation *It is in the North-East close to Venice* only possible for (11a)]

### Epistemic specificity

Indefinites marked for (un)known signal that the speaker does (not) know the identity of the referent

(12) A student called.

- a. **Known:** The speaker knows which student called.

- b. **Unknown:** The speaker doesn't know which student called.

## Specific Known, Specific Unknown and Non-Specific

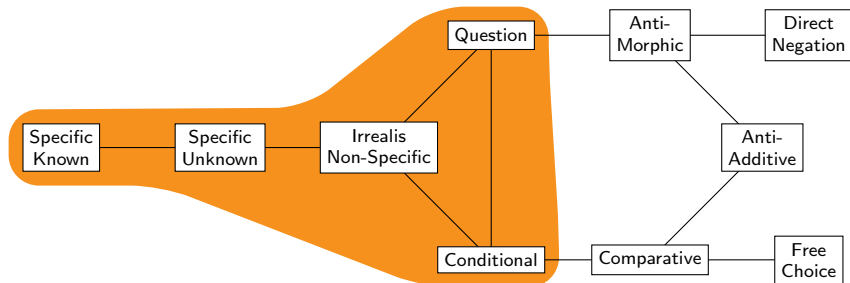

- (13) a. **Specific known (SK)**: scopal specific & epistemic specific  
b. **Specific unknown (SU)**: scopal specific & epistemic non-specific  
c. **Non-specific (NS)**: scopal non-specific

### Illustration

- (14) Ali wants to visit an Italian city.
- a. **SK**: There is a specific city which Ali wants to visit, and the speaker knows which
- b. **SU**: There is a specific city which Ali wants to visit, but the speaker doesn't know which
- c. **NS**: Ali wants to visit an Italian city, any Italian city would do

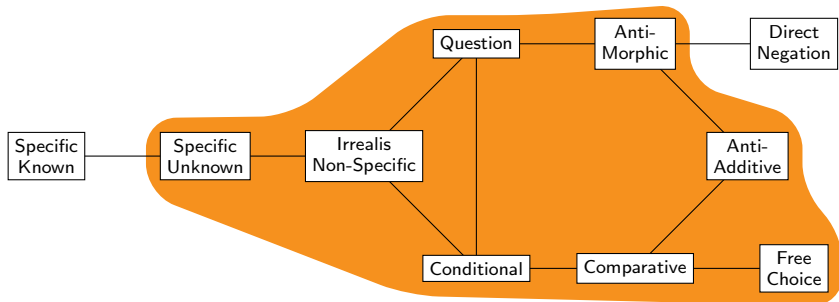

Cross-linguistically, languages developed lexicalized forms with restricted distributions with respect to these uses.

# Haspelmath Map

# Haspelmath Map

Kazakh *älde*

## Our Goals

- (1) a logical characterization of the **specific known (SK)**, **specific unknown (SU)** and **non-specific (NS) functions**; and a principled explanation of their position on Haspelmath's implicational map;
- (2) a formal account of the variety of marked indefinites encoding SK, SU, and NS: **specific known, epistemic, specific and non-specific indefinites**; and their properties.
- (3) explanation of observed diachronic pathway from non-specific to epistemic.

**Main idea:** Indefinites are sensitive to *dependence* and *non-dependence* relationships in their value assignments (building on insights from Brasoveanu and Farkas 2011; Farkas and Brasoveanu 2020).

**Implementation:** Two-sorted team semantics with dependence atoms.

## Marked Indefinites

Possible **marked indefinites** based on Specific Known (SK), Specific Unknown (SU) and Non-specific (NS):

TYPE OF INDEFINITE	FUNCTIONS			EXAMPLE
	SK	SU	NS	
(i) unmarked	✓	✓	✓	Italian <i>qualcuno</i>
(ii) specific	✓	✓	✗	Georgian <i>-ghats</i>
(iii) non-specific	✗	✗	✓	Russian <i>-nibud</i>
(iv) epistemic	✗	✓	✓	German <i>irgend-</i>
(v) specific known	✓	✗	✗	Russian <i>koe-</i>
(vi) SK + NS	✓	✗	✓	unattested
(vii) specific unknown	✗	✓	✗	Kannada <i>-oo</i>

## Marked Indefinites

Possible **marked indefinites** based on Specific Known (SK), Specific Unknown (SU) and Non-specific (NS):

TYPE OF INDEFINITE	FUNCTIONS			EXAMPLE
	SK	SU	NS	
(i) unmarked	✓	✓	✓	Italian <i>qualcuno</i>
(ii) specific	✓	✓	✗	Georgian <i>-ghats</i>
(iii) non-specific	✗	✗	✓	Russian <i>-nibud</i>
(iv) epistemic	✗	✓	✓	German <i>irgend-</i>
(v) specific known	✓	✗	✗	Russian <i>koe-</i>
(vi) SK + NS	✓	✗	✓	unattested
(vii) specific unknown	✗	✓	✗	Kannada <i>-oo</i>

How to capture this variety?

## Marked Indefinites

Possible **marked indefinites** based on Specific Known (SK), Specific Unknown (SU) and Non-specific (NS):

TYPE OF INDEFINITE	FUNCTIONS			EXAMPLE
	SK	SU	NS	
(i) unmarked	✓	✓	✓	Italian <i>qualcuno</i>
(ii) <b>specific</b>	✓	✓	✗	Georgian <i>-ghats</i>
(iii) <b>non-specific</b>	✗	✗	✓	Russian <i>-nibud</i>
(iv) <b>epistemic</b>	✗	✓	✓	German <i>irgend-</i>
(v) <b>specific known</b>	✓	✗	✗	Russian <i>koe-</i>
(vi) SK + NS	✓	✗	✓	<b>unattested</b>
(vii) specific unknown	✗	✓	✗	Kannada <i>-oo</i>

Why (ii)-(v) common? Why (vi) unattested? Why (vii) rare?

## Marked Indefinites

Possible **marked indefinites** based on Specific Known (SK), Specific Unknown (SU) and Non-specific (NS):

TYPE OF INDEFINITE	FUNCTIONS			EXAMPLE
	SK	SU	NS	
(i) unmarked	✓	✓	✓	Italian <i>qualcuno</i>
(ii) specific	✓	✓	✗	Georgian <i>-ghats</i>
<b>(iii) non-specific</b>	✗	✗	✓	Russian <i>-nibud</i>
(iv) epistemic	✗	✓	✓	German <i>irgend-</i>
(v) specific known	✓	✗	✗	Russian <i>koe-</i>
(vi) SK + NS	✓	✗	✓	unattested
(vii) specific unknown	✗	✓	✗	Kannada <i>-oo</i>

How to derive the restricted distribution of non-specific indefinites (ungrammatical in episodic sentences)?

## Marked Indefinites

Possible **marked indefinites** based on Specific Known (SK), Specific Unknown (SU) and Non-specific (NS):

TYPE OF INDEFINITE	FUNCTIONS			EXAMPLE
	SK	SU	NS	
(i) unmarked	✓	✓	✓	Italian <i>qualcuno</i>
(ii) specific	✓	✓	✗	Georgian <i>-ghats</i>
(iii) non-specific	✗	✗	✓	Russian <i>-nibud</i>
(iv) epistemic	✗	✓	✓	German <i>irgend-</i>
(v) specific known	✓	✗	✗	Russian <i>koe-</i>
(vi) SK + NS	✓	✗	✓	unattested
(vii) specific unknown	✗	✓	✗	Kannada <i>-oo</i>

How to characterize the obligatory ignorance inferences typical of epistemic indefinites? And the knowledge inference typical of specific known indefinites?

## Marked Indefinites

Possible **marked indefinites** based on Specific Known (SK), Specific Unknown (SU) and Non-specific (NS):

TYPE OF INDEFINITE	FUNCTIONS			EXAMPLE
	SK	SU	NS	
(i) unmarked	✓	✓	✓	Italian <i>qualcuno</i>
(ii) specific	✓	✓	✗	Georgian <i>-ghats</i>
(iii) non-specific	✗	✗	✓	Russian <i>-nibud</i>
(iv) epistemic	✗	✓	✓	German <i>irgend-</i>
(v) specific known	✓	✗	✗	Russian <i>koe-</i>
(vi) SK + NS	✓	✗	✓	unattested
(vii) specific unknown	✗	✓	✗	Kannada <i>-oo</i>

Indefinites in general display exceptional scope behaviour. Why? How to account for their exceptional scope? What scope configurations are possible for marked indefinites (e.g. narrow, intermediate, wide)?

## Language & Teams

Team semantics: formulas are interpreted wrt **sets** of evaluation points (*teams*) rather than single points. Here a team is a set of assignment functions.

We use a **two-sorted team semantics** framework:

- (i) possible worlds introduced as second sort of entities (with special **world variables** which can be quantified over);
- (ii)  $v$  as **designated variable** over worlds, representing alternative ways things might be (epistemic possibilities).

Examples:

(15) Everybody smiles  $\mapsto \forall xS(x, v)$  & Everybody must smile  $\mapsto \forall w\forall xS(x, w)$

**Language:**

$z ::= z_d \mid z_w$

$\phi ::= P(\vec{z}) \mid \neg P(\vec{z}) \mid \phi \vee \psi \mid \phi \wedge \psi \mid \exists_{strict} z\phi \mid \exists_{lax} z\phi \mid \forall z\phi \mid dep(\vec{z}, z) \mid var(\vec{z}, z)$

A **model** is a triple  $M = \langle D, W, I \rangle$ , where  $D$  is a set of individuals,  $W$  a set of worlds and  $I$  an interpretation function.

A function  $f$  with finite domain  $Z = Z_d \cup Z_w$  is an **assignment** (wrt model  $M = \langle D, W, I \rangle$ ) iff there are  $f_1, f_2$ :  $f = f_1 \cup f_2$  &  $f_1 \in D^{Z_d}$  &  $f_2 \in W^{Z_w}$

**Team:**

Given a model  $M = \langle D, W, I \rangle$  and a finite set of variables  $Z$ , a team  $T$  over  $M$  with domain  $Z$  is a set of assignments with domain  $Z$

## Teams as information states: initial teams

Teams represent information states of speakers.

In initial teams only factual information is represented.

**Initial team:** A team  $T$  is *initial* iff  $Dom(T) = \{v\}$ .

- The *designated world variable*  $v$  captures the speaker's epistemic possibilities.
- Teams where  $v$  receives only one value are teams of *maximal information*.

### Illustration

$[w_{Pa} \text{ means } \langle I_M(a), w_{Pa} \rangle \in I_M(R)]$

$$(16) \quad \frac{v}{\begin{array}{c} w_{Pa} \\ w_{Pb} \end{array}} \Rightarrow \text{the info that } Pa \text{ is true or } Pb \quad [\Leftarrow \text{initial team}]$$

$$(17) \quad \frac{v}{w_{Pa}} \Rightarrow \text{the info that } Pa \text{ is true} \quad [\Leftarrow \text{initial team of max info}]$$

**Felicitous sentence:** A sentence is *felicitous/grammatical* if there is an initial team which supports it.

## Teams as information states: adding discourse information

In initial teams only factual information is represented.

Discourse information is then added by operations of **assignment extensions** (Galliani 2015).

$v$	$x$	$w$	$y$	$\dots$
$v_1$	$a$	$w_1$	$b_1$	$\dots$
$v_2$	$a$	$w_2$	$b_2$	$\dots$
$\dots$	$a$	$\dots$	$\dots$	$\dots$
$v_n$	$a$	$w_n$	$b_n$	$\dots$

### Illustration: non-initial teams

$$(18) \quad \begin{array}{c|c} v & x \\ \hline w_1 & a \\ w_2 & a \\ w_3 & a \end{array} \Rightarrow \text{value of } x \text{ is known}$$

$$(19) \quad \begin{array}{c|c} v & x \\ \hline w_1 & a \\ w_2 & b \\ w_3 & c \end{array} \Rightarrow \text{unknown but specific} \quad \begin{array}{c|c} v & x \\ \hline w_1 & a \\ w_1 & b \\ w_1 & c \end{array} \Rightarrow \text{non-specific}$$

Linguistically relevant distinctions that we can characterise using **dependence & variation atoms**

## Universal Extension

$$T[z_*] = \{i[e_*/z_*] : i \in T \text{ and } e_* \in \text{Dom}_*(M)\}$$

[where  $* \in \{d, w\}$  &  $\text{Dom}_d(M) = D$  &  $\text{Dom}_w(M) = W$ ]

A **universal extension** of a team  $T$  with  $y$ , denoted by  $T[y]$ , amounts to consider all assignments that extend or differ from the ones in  $T$  only with respect to the value of  $y$ .

$v$	$T$
$v_1$	$i_1$
$v_2$	$i_2$

$v$	$y$	$T[y]$
$v_1$	$d_1$	$i_{11}$
	$d_2$	$i_{12}$
$v_2$	$d_1$	$i_{21}$
	$d_2$	$i_{22}$

( $D = \{d_1, d_2\}$ ). Universal extensions are unique. They allow *branching*.)

## Strict Functional Extension

$$T[h_s/z_*] = \{i[h_s(i)/z_*] : i \in T\}, \text{ for some strict function } h_s : T \rightarrow \text{Dom}_*(M)$$

A **strict functional extension** of a team  $T$  with  $y$ ,  $T[h_s/y]$ , assigns only one value to  $y$  for each original assignment in  $T$ .

$v$	$T$
$v_1$	$i_1$
$v_2$	$i_2$

With  $D = \{d_1, d_2\}$  we have 4 possible strict functional extensions. No branching allowed:

$v$	$y$	$T[h_1/y]$
$v_1 \rightarrow d_1$		$i_{11}$
$v_2 \rightarrow d_1$		$i_{21}$

$v$	$y$	$T[h_2/y]$
$v_1 \rightarrow d_2$		$i_{12}$
$v_2 \rightarrow d_2$		$i_{21}$

$x$	$y$	$T[h_3/y]$
$v_1 \rightarrow d_1$		$i_{11}$
$v_2 \rightarrow d_2$		$i_{21}$

$x$	$y$	$T[h_4/y]$
$v_1 \rightarrow d_2$		$i_{12}$
$v_2 \rightarrow d_1$		$i_{21}$

## Lax Functional Extension

$T[f_l/z_*] = \{i[e_*/z_*] : i \in T \ \& \ e_* \in f_l(i)\}$ , for some lax function  $f_l : T \rightarrow \wp(\text{Dom}_*(M)) \setminus \{\emptyset\}$

A **lax functional extension** of a team  $T$  with  $y$ ,  $T[f_l/y]$ , amounts to assign one or more values to  $y$  for each original assignment in  $T$ .

$v$	$T$
$v_1$	$i_1$
$v_2$	$i_2$

$v$	$y$	$T[f_l/y]$
$v_1$	$\rightarrow d_2$	$i_{12}$
$v_2$	$\rightarrow d_1$	$i_{21}$
	$\rightarrow d_2$	$i_{22}$

(With  $D = \{d_1, d_2\}$ , 9 possible lax functional extensions. Branching allowed.)

## Semantic Clauses

$M, T \models P(z_1, \dots, z_n)$	$\Leftrightarrow$	$\forall j \in T : \langle j(z_1), \dots, j(z_n) \rangle \in I(P^n)$
$M, T \models \neg P(z_1, \dots, z_n)$	$\Leftrightarrow$	$\forall j \in T : \langle j(z_1), \dots, j(z_n) \rangle \notin I(P^n)$
$M, T \models \phi \wedge \psi$	$\Leftrightarrow$	$M, T \models \phi$ and $M, T \models \psi$
$M, T \models \phi \vee \psi$	$\Leftrightarrow$	$T = T_1 \cup T_2$ for teams $T_1$ and $T_2$ s.t. $M, T_1 \models \phi$ and $M, T_2 \models \psi$
$M, T \models \forall z \phi$	$\Leftrightarrow$	$M, T[z] \models \phi$
$M, T \models \exists_{\text{strict}} z \phi$	$\Leftrightarrow$	there is a strict $h_s : M, T[h_s/z] \models \phi$
$M, T \models \exists_{\text{lax}} z \phi$	$\Leftrightarrow$	there is a lax $f_l : M, T[f_l/z] \models \phi$
$M, T \models \text{dep}(\vec{z}, u)$	$\Leftrightarrow$	for all $i, j \in T : i(\vec{z}) = j(\vec{z}) \Rightarrow i(u) = j(u)$
$M, T \models \text{var}(\vec{z}, u)$	$\Leftrightarrow$	there is $i, j \in T : i(\vec{z}) = j(\vec{z}) \ \& \ i(u) \neq j(u)$

## Dependence and Variation Atoms

Dependence & variation atoms model (non-)dependency patterns between variables' values (Väänänen 2007; Galliani 2015):

### Dependence Atom:

$$M, T \models \text{dep}(\vec{z}, u) \Leftrightarrow \text{for all } i, j \in T : i(\vec{z}) = j(\vec{z}) \Rightarrow i(u) = j(u)$$

### Variation Atom:

$$M, T \models \text{var}(\vec{z}, u) \Leftrightarrow \text{there is } i, j \in T : i(\vec{z}) = j(\vec{z}) \ \& \ i(u) \neq j(u)$$

$T$	$x$	$y$	$z$	$l$
$i$	$a_1$	$b_1$	$c_1$	$d_1$
$j$	$a_1$	$b_1$	$c_2$	$d_1$
$k$	$a_3$	$b_2$	$c_3$	$d_1$

$\text{dep}(x, y) \checkmark$

$\text{var}(x, z) \checkmark$

$\text{dep}(\emptyset, l) \checkmark$

$\text{var}(\emptyset, x) \checkmark$

$\text{dep}(y, z) \times$

$\text{var}(x, y) \times$

## Indefinites as Existentials

We propose that:

- 1 Indefinites are **strict existentials** ( $\exists_{s(\text{strict})}X$ ).
- 2 They are interpreted *in-situ*.

**Dependence atoms** will be used to model the **exceptional scope** behaviour of indefinites, by specifying how their value (co-)varies with other operators.

**Dependence and variation atoms** will be used to capture the **variety** of marked indefinite forms, by specifying how their value (co-)varies with respect to the designated  $v$  variable.

(For scope, our system parallels Brasoveanu and Farkas (2011)'s treatment), see also Schlenker 2006).

## Application I: Exceptional Scope of Indefinites

Indefinites violate rules of standard quantifier behaviour, e.g. can escape syntactic islands (Reinhart 1979, Abush 1993, ...)

(20) Every kid<sub>x</sub> ate every food<sub>z</sub> that a doctor<sub>y</sub> recommended.

a. WS  $[\exists y/\forall x/\forall z]: \forall x\forall z\exists_s y(\phi \wedge dep(v, y))$

b. IS  $[\forall x/\exists y/\forall z]: \forall x\forall z\exists_s y(\phi \wedge dep(vx, y))$

c. NS  $[\forall x/\forall z/\exists y]: \forall x\forall z\exists_s y(\phi \wedge dep(vxz, y))$

v	x	z	y
v <sub>1</sub>	...	...	b <sub>1</sub>
v <sub>1</sub>	...	...	b <sub>1</sub>
v <sub>1</sub>	...	...	b <sub>1</sub>
v <sub>1</sub>	...	...	b <sub>1</sub>

WS:  $dep(v, y)$

v	x	z	y
v <sub>1</sub>	a <sub>1</sub>	...	b <sub>1</sub>
v <sub>1</sub>	a <sub>1</sub>	...	b <sub>1</sub>
v <sub>1</sub>	a <sub>2</sub>	...	b <sub>2</sub>
v <sub>1</sub>	a <sub>2</sub>	...	b <sub>2</sub>

IS:  $dep(vx, y)$

v	x	z	y
v <sub>1</sub>	a <sub>1</sub>	c <sub>1</sub>	b <sub>1</sub>
v <sub>1</sub>	a <sub>1</sub>	c <sub>2</sub>	b <sub>2</sub>
v <sub>1</sub>	a <sub>2</sub>	c <sub>3</sub>	b <sub>3</sub>
v <sub>1</sub>	a <sub>2</sub>	c <sub>4</sub>	b <sub>4</sub>

NS:  $dep(vxz, y)$

Indefinites interpreted *in-situ*. Exceptional scope behaviour captured using dependence atoms.

## Application II: Specific Known, Specific Unknown, Non-specific

constancy $\mapsto$ known	$dep(\emptyset, x)$	<table style="border-collapse: collapse; margin: auto;"> <tr><td style="padding: 0 10px;"><math>v</math></td><td style="padding: 0 10px;"><math>x</math></td></tr> <tr><td style="border-top: 1px solid black; padding: 0 10px;"><math>\dots</math></td><td style="border-top: 1px solid black; padding: 0 10px;"><math>d_1</math></td></tr> <tr><td style="padding: 0 10px;"><math>\dots</math></td><td style="padding: 0 10px;"><math>d_1</math></td></tr> </table>	$v$	$x$	$\dots$	$d_1$	$\dots$	$d_1$
$v$	$x$							
$\dots$	$d_1$							
$\dots$	$d_1$							
variation $\mapsto$ unknown	$var(\emptyset, x)$	<table style="border-collapse: collapse; margin: auto;"> <tr><td style="padding: 0 10px;"><math>v</math></td><td style="padding: 0 10px;"><math>x</math></td></tr> <tr><td style="border-top: 1px solid black; padding: 0 10px;"><math>\dots</math></td><td style="border-top: 1px solid black; padding: 0 10px;"><math>d_1</math></td></tr> <tr><td style="padding: 0 10px;"><math>\dots</math></td><td style="padding: 0 10px;"><math>d_2</math></td></tr> </table>	$v$	$x$	$\dots$	$d_1$	$\dots$	$d_2$
$v$	$x$							
$\dots$	$d_1$							
$\dots$	$d_2$

### Non-specific:

$v$ -variation  $var(v, x)$

$v$	$\dots$	$x$
$v_1$	$\dots$	$d_1$
$v_1$	$\dots$	$d_2$

## Application III: Variety of Indefinites

TYPE	FUNCTIONS			REQUIREMENT	EXAMPLE
	SK	SU	NS		
(i) unmarked	✓	✓	✓	none	Italian <i>qualcuno</i>
(ii) specific	✓	✓	✗	$dep(v, x)$	Georgian <i>-ghats</i>
(iii) non-specific	✗	✗	✓	$var(v, x)$	Russian <i>-nibud</i>
(iv) epistemic	✗	✓	✓	$var(\emptyset, x)$	German <i>-irgend</i>
(v) specific known	✓	✗	✗	$dep(\emptyset, x)$	Russian <i>-koe</i>
(vi) SK + NS	✓	✗	✓	$dep(\emptyset, x) \vee var(v, x)$	unattested
(vii) specific unknown	✗	✓	✗	$dep(v, x) \wedge var(\emptyset, x)$	Kannada <i>-oo</i>

Why (ii)-(v) common? Why (vi) unattested? Why (vii) rare?

common

**(ii)-(v):**  $\mapsto$  DEPENDENCE SQUARE OF OPPOSITION

unattested

**(vi) SK + NS:** violation of convexity (Gardenfors 2014)

rare

**(vii) specific unknown:** increased complexity

## Application III: Dependence Square of Opposition

DEPENDENCE SQUARE OF OPPOSITION

- Contraries: can be both false, but not both true.
- Subcontraries: they cannot both be false but can both be true.
- Subalternation:  
 $A$  subalternates  $B$  iff  
 $A$  implies  $B$ .
- Contradictories: cannot be both true and they cannot be both false.

## Application III: Violation of convexity

- Convexity often assumed as a constraint on concept formation and lexicalization [Gardenfors 2014; Enguehard and Chemla 2021]
- **Example:** color space
  - A space is **convex** just in case for every two points contained therein, the line connecting them lies entirely within the space.
  - Color words (*blue, white, red, dots*) denote convex areas in color space
  - *Blue or white* and *not red* instead do not denote convex areas  $\mapsto$  not natural concepts, not lexicalized
- Convexity without conceptual space: we need a relevant ordering
  - A meaning  $X$  is convex iff given  $A < B < C$  and  $A$  in  $X$  and  $C$  in  $X$  then also  $B$  in  $X$
- Indefinite functions SK, SU, NS  $\mapsto$  sentential meanings
- In classical semantic theory, sentential meanings are sets of possible worlds. Unclear how worlds should be ordered.
- In team semantics: sentential meanings  $\mapsto$  sets of teams.

$$[\phi]_M = \{T \mid M, T \models \phi\}$$

We can use  $\subseteq$  as relevant ordering for defining convexity

## Application III: Violation of convexity

- **Convex sets of teams:**

- A set of teams  $P$  is convex iff for all  $T_1, T_2, T_3$  such that  $T_1 \subseteq T_2 \subseteq T_3$ , if  $T_1 \in P$  and  $T_3 \in P$ , then  $T_2 \in P$ .

- The Boolean union of the formulas associated with the SK and NS cells in our map does not satisfy convexity:

- SK + NS:  $dep(\emptyset, x) \vee var(v, x)$  [not convex]

- The other two combinations instead define convex sets:

- SK + SU:  $dep(\emptyset, x) \vee (var(\emptyset, x) \wedge dep(v, x)) \equiv dep(v, x)$  [convex]

- SU + NS:  $(var(\emptyset, x) \wedge dep(v, x)) \vee var(v, x) \equiv var(\emptyset, x)$  [convex]

- A reasonable constraint on implicational maps: contiguous cells must denote convex properties (no gaps allowed!)
- This gives us a principled explanation of the specific ordering among functions assumed in the original Haspelmath's map:

SK-SU-NS      yes

SU-SK-NS      no

SK-NS-SU      no

## Application IV: Licensing of non-specific indefinites

Non-specific indefinites are **ungrammatical in episodic sentences** and they need an operator (e.g. a universal quantifier, a modal or an attitude verb) which licenses them:

- (21)\* *Ivan včera kupil kakuju-nibud' knigu.*  
 Ivan yesterday bought which-INDEF. book.

'Ivan bought some book [non-specific] yesterday.'

- (22) *Ivan hotel spet' kakuju-nibud' pesniu.*  
 Ivan want-PAST sing-INF some-nibud song.

'Ivan wanted to sing some song [non-specific].'

## Application IV: Licensing of non-specific indefinites

Recall that non-specific indefinites are strict existentials which trigger  $v$ -variation:  $var(v, x)$ .

$$\exists_s x (\phi \wedge var(v, x))$$

$$\frac{\frac{\frac{}{v}}{v_1}}{v_2}}$$

## Application IV: Licensing of non-specific indefinites

Recall that non-specific indefinites are strict existentials which trigger  $v$ -variation:  $var(v, x)$ .

$$\exists_s x (\phi \wedge var(v, x))$$

$v$
$v_1$
$v_2$

$v$	$x$
$v_1$	$a_1$
$v_2$	$a_2$

$var(v, x)$  cannot be satisfied!

No initial team can support  $\exists_s x (\phi \wedge var(v, x))$

$\Rightarrow$  Non-specific indefinites predicted to be infelicitous in episodic sentences

## Application IV: Licensing of non-specific indefinites

Recall that non-specific indefinites are strict existentials which trigger  $v$ -variation:  $var(v, x)$ .

$$\forall y \exists_s x (\phi \wedge var(v, x))$$

$v$	$v$	$y$
$v_1$	$v_1$	$b_1$
$v_2$	$v_2$	$b_2$

## Application IV: Licensing of non-specific indefinites

Recall that non-specific indefinites are strict existentials which trigger  $v$ -variation:  $var(v, x)$ .

$$\forall y \exists_s x (\phi \wedge var(v, x))$$

$v$	$v$	$y$	$v$	$y$	$x$	$var(v, x)$ satisfied!
$v_1$	$v_1$	$b_1$	$v_1$	$b_1$	$a_1$	
$v_2$	$v_2$	$b_2$	$v_2$	$b_1$	$a_1$	
	$v_2$	$b_2$	$v_2$	$b_2$	$a_2$	

Initial teams can support  $\forall y \exists_s x (\phi \wedge var(v, x))$

$\Rightarrow$  Non-specific indefinites predicted to be felicitous in universally quantified sentences

## Application IV: Licensing of non-specific indefinites

Non-specific indefinites can also be licensed by modals or attitude verbs:

(23)\* *On kupil        kakoj-nibud' tort.*  
 He buy-PAST some-nibud cake.

'He bought a cake.'

(24) *Ivan hotel        spet'        kakuju-nibud' pesniu.*  
 Ivan want-PAST sing-INF some-nibud song.

'Ivan wanted to sing some song [non-specific].'

(25) *On mog        kupit'        kakoj-nibud' tort.*  
 He can-PAST buy-INF some-nibud cake

'He could buy a cake.'

## Application IV: Licensing of non-specific indefinites

### Basic Idea:

Modals as **lax quantifiers** over worlds:  $\Box_w \sim \forall w$  and  $\Diamond_w \sim \exists_{I(ax)} w$

(26) Necessity Modal

- a. You must take some-*nibud* book
- b.  $\forall w \exists_s x (\phi(x, w) \wedge \text{var}(v, x))$

(27) Possibility Modal

- a. You may take some-*nibud* book
- b.  $\exists_I w \exists_s x (\phi(x, w) \wedge \text{var}(v, x))$

## Application IV: Licensing of non-specific indefinites

We obtain the correct licensing behaviour!

$$\exists_I w \exists_s x (\phi(x, w) \wedge \text{var}(v, x))$$

$v$	$v$	$w$	$v$	$w$	$x$	$\text{var}(v, x)$ satisfied!
$v_1$	$v_1$	$w_1$	$v_1$	$w_1$	$a_1$	
$v_2$	$v_2$	$w_2$	$v_2$	$w_2$	$a_2$	
$v_2$	$v_2$	$w_1$	$v_2$	$w_1$	$a_1$	

Initial teams can support  $\exists_I w \exists_s x (\phi(x, w) \wedge \text{var}(v, x))$

$\Rightarrow$  Non-specific indefinites predicted to be felicitous under (possibility) modals  
(but not under other indefinites (strict existential))

## Aside: Epistemic Modals via Inclusion Atoms

### (28) Epistemic vs Deontic

- a. Aicha might be in Paris.
- b. Aicha is allowed to go to Paris.

Only epistemic modals give rise to **epistemic contradictions**:

(29) # Aicha might be in Paris and she is not in Paris.

**Epistemic modals** quantify over epistemic possibilities of the speaker (encoded by  $v$  in our system).

**Deontic modals** interpreted wrt 'normative' rules, not necessarily compatible with the state of affairs in the actual world.

## Aside: Epistemic Modals via Inclusion Atoms

**Proposal:** epistemic modals as inclusion atoms triggers

(30) a. Aicha might be in Paris.

b.  $\exists w (P(a, w) \wedge w \subseteq v)$

**Inclusion Atom:**

$M, T \models \vec{x} \subseteq \vec{y} \Leftrightarrow$  for all  $i \in T$ , there is a  $j \in T : i(\vec{x}) = j(\vec{y})$

$x$	$y$	$z$	
$d_1$	$d_1$	$d_2$	$x \subseteq y$ ✓
$d_1$	$d_2$	$d_2$	$xz \subseteq xy$ ✓
$d_2$	$d_3$	$d_4$	$y \subseteq x$ ✗
$d_2$	$d_4$	$d_4$	

### General picture

**Indefinites:** strict existentials over individual variables  
differences captured via  $\Rightarrow$  Dependence and Variation Atoms

**Modals:** lax quantifiers over world variables  
differences captured via  $\Rightarrow$  Inclusion Atoms

## Aside: Epistemic Modals via Inclusion Atoms

### (31) Epistemic

- a.  $\#$  Aicha might be in Paris and she is not in Paris.  
 b.  $\exists ! w (P(a, w) \wedge w \subseteq v) \wedge \neg P(a, v) \models \perp$

### (32) Deontic

- a. Aicha is allowed to be in Paris and she is not in Paris.  
 b.  $\exists ! w (P(a, w) \wedge R(v, w)) \wedge \neg P(a, v) \not\models \perp$

$v$	$v$	$w$	$v$	$w$
$v_1$	$v_1$	$v_1$	$v_1$	$w_1$
$v_2$	$v_1$	$v_2$	$v_1$	$w_2$
$v_3$	$v_2$	$v_1$	$v_2$	$w_1$
	$v_2$	$v_2$	$v_2$	$w_2$
	$v_3$	$v_1$	$v_3$	$w_1$
	$v_3$	$v_2$	$v_3$	$w_2$

Epistemic

Deontic

## Application V: From non-specific to epistemic

Frequent diachronic tendency: **non-specific** > **epistemic** (e.g. French *quelque* (Foulet 1919) and German *irgendein* (Port and Aloni 2015))

Haspelmath (1997)'s explanation: weakening of functions from the right (non-specific) of the functional map to the left (specific).

(33) **Weakening of functions (a) > (b) > (c)**

(a) non-specific

(b) non-specific + specific unknown = epistemic

(c) epistemic + specific known = unmarked

But then why diachronically we do not observe the change from (b) to (c)?

## Application V: Dependence Square of Opposition

Our framework makes the notion of weakening precise in terms of **subalternation** in our square of opposition

By subalternation we predict the following possible diachronic developments:

- (i) NON-SPECIFIC > EPISTEMIC (attested)
- (ii) SPECIFIC KNOWN > SPECIFIC (conjectured)

But (ii) might violate another constraint on language change

## Application V: concrete > abstract

- The representation of **known vs unknown** requires variables ranging over  $W$ , a domain of abstract entities
  - Without world variables:** Specific ( $dep(\emptyset, x)$ ) vs Non-specific ( $var(\emptyset, x)$ )
  - With world variables:** Dependence Square of Opposition
- It is reasonable to conjecture that individual quantification precedes world quantification

concrete > abstract

- This conjecture gives rise to different predictions concerning diachronic tendencies:
  - (i) NON-SPECIFIC > EPISTEMIC (attested)
  - (ii) SPECIFIC > SPECIFIC KNOWN (conjectured)
- Possibly both factors (weakening and concreteness) play a role explaining why only (i) is frequently attested

	weakening	concreteness
NON-SPECIFIC > EPISTEMIC	yes	yes
SPECIFIC > SPECIFIC KNOWN	no	yes
SPECIFIC KNOWN > SPECIFIC	yes	no
EPISTEMIC > SPECIFIC KNOWN	no	=

## Final Proposal

We propose that:

- ① Indefinites are **strict existentials**;
- ② They are interpreted **in-situ**;
- ③ An unmarked/plain indefinite  $\exists_s x$  in **syntactic scope** of  $O_{\vec{z}}$  allows all  $dep(\vec{y}, x)$ , with  $\vec{y}$  included in  $v\vec{z}$ :

$$O_{z_1} \dots O_{z_n} \exists_s x (\phi \wedge dep(\vec{y}, x))$$

- ④ **Marked indefinites** additionally trigger the obligatory activation of particular dependence or variation atoms.

## Final Proposal

$$O_{z_1} \dots O_{z_n} \exists_s x (\phi \wedge \dots)$$

**Unmarked:**  $dep(\vec{y}, x)$ , where  $\vec{y} \subseteq v\vec{z}$

**Specific known:**  $dep(\vec{y}, x)$  with  $\vec{y} = \emptyset$

**Specific:**  $dep(\vec{y}, x)$  with  $\vec{y} = v$

**Epistemic:**  $dep(\vec{y}, x) \wedge var(\vec{z}, x)$  with  $\vec{z} = \emptyset$

**Non-specific:**  $dep(\vec{y}, x) \wedge var(\vec{z}, x)$  with  $\vec{z} = v$

**Specific unknown:**  $dep(\vec{y}, x) \wedge var(\vec{z}, x)$  with  $\vec{y} = v$  and  $\vec{z} = \emptyset$

## Application VI: Interaction with Scope

$$\forall z \forall y \exists_s x \phi$$

	WS-K $dep(\emptyset, x)$	WS $dep(v, x)$	IS $dep(vy, x)$	NS $dep(vyz, x)$
unmarked	✓	✓	✓	✓
specific $dep(v, x)$	✓	✓	✗	✗
non-specific $var(v, x)$	✗	✗	✓	✓
epistemic $var(\emptyset, x)$	✗	✓	✓	✓
specific known $dep(\emptyset, x)$	✓	✗	✗	✗
specific unknown $dep(v, x) \wedge var(\emptyset, x)$	✗	✓	✗	✗

Note that non-specific indefinites also allow intermediate readings (Partee 2004):

(34) *Možet byt', Maša xočet kupit' kakuju-nibud' knigu.*  
 may be, Maša want buy which-INDEF. book.

- Narrow Scope: It may be that Maša wants to buy some book.
- Intermediate Scope: It may be that there is some book which Maša wants to buy.
- #Wide-scope: There is some book such that it may be that Maša wants to buy it.

## Negation and Implication

Negation so far can only be defined for the classical fragment of the language (including identity<sup>1</sup>).

To express natural language negation we can adopt an intensional notion, along the lines of Brasoveanu and Farkas (2011).

### (35) Intensional Negation

$$\neg\phi \Leftrightarrow \forall w(\phi[v/w] \rightarrow v \neq w)$$

### (36) Clause for Implication

$M, X \models \phi \rightarrow \psi \Leftrightarrow$  for **some**  $X' \subseteq X$  s.t.  $M, X' \models \phi$  and  $X'$  is maximal (i.e. for all  $X''$  s.t.  $X' \subset X'' \subseteq X$ ,  $M, X'' \not\models \phi$ ), we have  $M, X' \models \psi$

---

1

$$M, T \models x \neq y \Leftrightarrow \forall i \in T : i(x) \neq i(y)$$

## Negation and Epistemic Indefinites

Desideratum: EIs under negation display an NPI behaviour (e.g., *any*).

EIs under negation as in (37) are supported when the initial team contains just  $\{w_\emptyset\}$ . (In  $w_\emptyset$  John read no book, in  $w_a$  John read only book *a*, and so on.)

(37) a. John does not have *irgend*-book.

b.  $\forall w(\exists_s x(\phi(x, w) \wedge dep(vw, x) \wedge var(\emptyset, x)) \rightarrow \mathbf{v} \neq \mathbf{w})$

$v$	$w$	$x$
$w_\emptyset$	$w_\emptyset$	—
$w_\emptyset$	$w_a$	<i>a</i>
$w_\emptyset$	$w_b$	<i>b</i>
$w_\emptyset$	$w_{ab}$	<i>b</i>

$v$	$w$	$x$
$w_a$	$w_\emptyset$	—
$w_a$	$w_a$	<i>a</i>
$w_a$	$w_b$	<i>b</i>
$w_a$	$w_{ab}$	<i>a</i>

[maximal teams supporting antecedent in blue; in red assignments violating consequent]

## Negation and Specific Indefinites

Does the *some/all* distinction matter in the semantic clause for maximal implication?

For union-closed formulas, it does not. The difference is trivialized.

But not all formulas in our language are union-closed!

Let's consider what happens in the case of specific (known) indefinites.

(38) a. John does not have some-SK book.

$$b. \forall w(\exists_s x(\phi(x, w) \wedge \text{dep}(\emptyset, x)) \rightarrow v \neq w)$$

As in (38), specific indefinites under negation are supported by  $\{w_\emptyset\}$  (John has no book), and also by  $\{w_a\}$  (John has book *a* and not *b*) or  $\{w_b\}$ . But not by  $\{w_{ab}\}$  (John has all books).

## Supporting and Non-Supporting Teams

(39) a. John does not have some-SK book.

b.  $\forall w(\exists_s x(\phi(x, w) \wedge dep(\emptyset, x)) \rightarrow v \neq w)$

$v$	$w$	$x$
$w_\emptyset$	$w_\emptyset$	$a$
$w_\emptyset$	$w_a$	$a$
$w_\emptyset$	$w_b$	$a$
$w_\emptyset$	$w_{ab}$	$a$

---

$v$	$w$	$x$
$w_\emptyset$	$w_\emptyset$	$b$
$w_\emptyset$	$w_a$	$b$
$w_\emptyset$	$w_b$	$b$
$w_\emptyset$	$w_{ab}$	$b$

$v$	$w$	$x$
$w_a$	$w_\emptyset$	$a$
$w_a$	$w_a$	$a$
$w_a$	$w_b$	$a$
$w_a$	$w_{ab}$	$a$

---

$v$	$w$	$x$
$w_a$	$w_\emptyset$	$b$
$w_a$	$w_a$	$b$
$w_a$	$w_b$	$b$
$w_a$	$w_{ab}$	$b$

$v$	$w$	$x$
$w_{ab}$	$w_\emptyset$	$a$
$w_{ab}$	$w_a$	$a$
$w_{ab}$	$w_b$	$a$
$w_{ab}$	$w_{ab}$	$a$

---

$v$	$w$	$x$
$w_{ab}$	$w_\emptyset$	$b$
$w_{ab}$	$w_a$	$b$
$w_{ab}$	$w_b$	$b$
$w_{ab}$	$w_{ab}$	$b$

[only for  $\{w_{ab}\}$  no maximal team supporting the antecedent also supports the consequent, therefore  $\{w_\emptyset\}$ ,  $\{w_a\}$  support (39b) but  $\{w_{ab}\}$  doesn't.]

## Conclusion

We have developed a **two-sorted team semantics** framework accounting for indefinites cross-linguistically.

In this framework, **marked indefinites** trigger the obligatoriness of dependence or variation atoms, responsible for their scopal and epistemic interpretations.

We have applied the framework to characterize the **typological variety of indefinites** in the case of (non-)specificity.

We have then showed how this system can be used to explain several **properties and phenomena** associated with (non-)specific indefinites.

THANK YOU!<sup>2</sup>
